Design Document (back office)

A design document, giving the overall structure of your solution, showing the *classes* and *methods* as a diagram or table, with *a brief (one sentence) description of the intention* of each.

Class: backend	
Intention: backend system of the banking system	
Methods	**Intentions**
readOldMaster(String fileName)	Read the old master account file
readTrans(String fileName)	Read new transaction summary file(s)
updateMaster(String[] updateFile)	update master account file with new transaction summary file(s)
updateValid(String[] updateFile)	update the valid account list with new transaction summary file(s)
reverseSort()	Sort the master account in descending order
newValidList()	Create the new valid account list based on old master account + new transaction summary files
checkMaster(ArrayList<String> result)	Check constraints of the new master account file
writeMaster(String path)	write new master account file
writeValid(String path)	write new valid account list
main(String args[])	Main function of the class

Class: *accounts*	
Intention: The class to store account information including balance	
Methods	**Intentions**
accounts(int number, long balance, String name)	Constructor for the accounts class, set values to local attributes
setBalance(double number)	Call by other class in order to modify the balance
getAccountNumber()	Return the account number
getAccountBalance()	Return the account balance
getAccountName()	Return the account name
toString()	To String method

In particular, the backend class will take at least two inputs, where the first input is the old master account file, the rest of inputs will be transaction summary file(s). Through the prototype, if all constraints are met, the old master account file will be updated using the input transaction summary file(s) and sorted in reverse order according to account numbers. Also, a new valid list file will be created using the input transaction summary file(s). The program will then write the new master account file and new valid account list.

Table of Results are in Test table

Detailed Failure Report for our test runs

Test number	Test Purpose	How output failed	Code error	How it was fixed
All test	All testing	All test cases involves	Error was in code.	Fixed by changing the

cases involves using the reverse sort function	purposes	the use of the *reverse sort* function does not produce the expected output.	Inequality operators are written in the opposite direction.	sign (> to <) in *reverseSort* function
Multiple tests	All testing purposes	Some test cases such as wrong transaction summary format are failed to be checked with the backend	Logical issue in code structure and test designing	We have modify/deleted such test cases since the backend assumes the front end input files are correct and make sure the output format are correct. Such test cases should be re-visited in Integration.
Multiple tests	All testing purposes	Master account write format should be 000 for empty balance but appeared to be 0.0	Error was in code.	Fixed by changing zero balance to 000 string and let other accounts with balance to case to be integer
WR1T1	Check if master account file holds a line that exceeding 47 characters.	Instead of giving the "Exceeding length" error, program gives "Success"	Error was in test.	We found out that if the input is a number, it will automatically cast to scientific notation. We then changed the test code to alphabetic characters. (since large amounts in scientific notation should be allowed)
WR5T5	Check If account name are legal	Legal name widraw operation should be successful but failed	Error was in test. Did not give enough balance to the account.	Modified the test code so that account balance is enough for widraw.
WR6T1	Check if monetary	Should print "Error"	Error in code	Fixed by adding

	is less than 3 digits	but did not.	Did not check if the account number begin with 0	constraints to the string at char(0).
All Test cases	Check if program should terminate upon error or continue to work	Failure as display by maven	Error in code.	Found that boolean value is not working properly. Use String as the end check instead.

createacct (white box input partition testing)

constraints for files	Requirement	Partition	Test No.	content in transaction summary file	content in old master accounts file	expected new master file	expected new valid account list	expected terminal output	Table of Results	
constraints for master accounts file	each line in master file has at most 47 characters(plus newline)	more than 47 characters	R1T1	NEW 1234568 000 0000000 name	1234567 1000 nameeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee	Error	Error	Exceeding length	As expected
